BoreDM Workflows for California Consultants: How BoreDM Helps Firms Meet Caltrans Requirements While Leveraging Their Preferred Software Workflows

Caltrans' recent move to accept deliverables from any software platform is a meaningful a positive change. But will this create freedom or just swap one proprietary format for another? BoreDM has already helped firms in Texas navigate the same exact transition. When TxDOT consultants needed more flexibility than WinCore could offer, we built workflows that preserved full compatibility with state requirements while giving teams room to work the way they prefer. We're excited to bring that same approach to California. In this session, we'll walk through how to stay fully aligned with new Caltrans specifications while using modern capabilities such as automated cross-sections, custom API-based analysis tools, and integrations with platforms like OpenRoads. The goal is simple: ensure consultants can comply with state standards — without being constrained to legacy software or workflows.
